

Big Apple: An Office Networking Platform

Team Members:

Jay Jayesh Shah: jjs816

Anshul Garg: ag6516

Big Apple is an application that allows all the employee to connect and update each other with their existing projects, form teams to contribute to projects, update their skills and interest in their profiles, add certifications, share pictures and location of the conferences, events and socialize with other employee across the firm.

Following are the functionalities of the system:

Create/Register a Big Apple profile:

All employees of the organization are allowed to create a profile on Big Apple. The employee can make the profile public or private upon his discretion. Once the employee deletes his profile, all the data corresponding to the employee profile will be deleted.

Create or Update Posts on the Wall:

Employees can create and update posts on their wall. The posts can be anything specific to the employee. Examples of which can be all the courses that he is takes, his views on modern technologies, hotlinks to his github repository, twitter handle etc. He can also create post specific to the project and provide his team explicitly to view the content.

Network and build relationships:

Big Apple allows an employee to network and collaborate with other employees by sending a connect request. An employee can also use Big Apple to form teams and collaborate with the team members in project activities. Connection can be team, friends or distinct friends given the scenario.

Upload Multimedia Contents:

Employees can post pictures, videos etc of presentation, conferences, training resources with Big Apple providing the provision to either share it across team or across the organization.

Adding Location details and Comments :

Employees can post their location details on Big Apple that allows others to know where you are. This feature can be used when the employee attends a event and would like to showcase his presence across the organizations. Big Apple allows an employee to comment on post and also allows him to make the comment restricted to Team or Public .

Likes:

Employees can like posts, comment or multimedia contents posted by an employee.

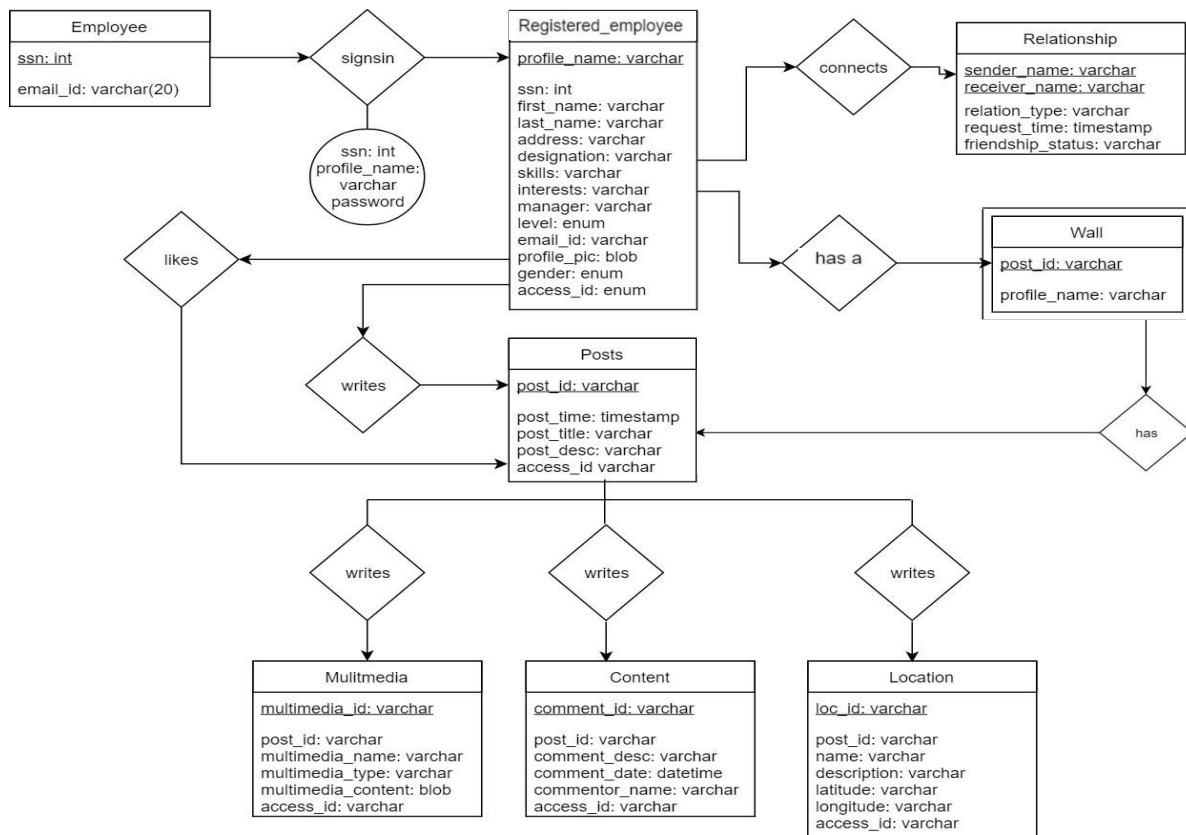

Database Requirements:

Big Apple will be designed as a relational database application which will be using MySQL as its database server.

MySQL version:

Variable_name	Value
version_compile_machine	x86_64
tls_version	TLSv1,TLSv1.1
version_comment	MySQL Community Server (GPL)
version_compile_os	macos10.12
innodb_version	5.7.19
version	5.7.19
protocol_version	10

Entity Relationship Diagram:

Assumptions:

- Every employee is assigned a level between A to D where A refers to Junior associates, B refers to senior associates, C refers to managers, D refers to CEO, President, Trustee. By default a new employee is assigned the level A following which the HR assigns the corresponding level based on their skills and experience.
- Access id are allowed at the profile and post level.
- Access id's can be S: Self, T: Team, F: Friends, FOF : Friend and Friends of Friends, P: Public.
- Relation_type in the relationship table indicates the type of friendship, F: Friends, FOF: Friend of Friends, T: Team.

Relational Schema:

- employee(ssn,email_id)
- signin(ssn,password)
- registered_employee(profile_name,ssn,first_name, last_name, address, designation, skills, interests, manager, level,access_id,email_id, profile_pic,gender)
- post(post_id, post_date, post_title, post_desc,access_id)
- wall(post_id, profile_name)
- relationship(sender_name, receiver_name, relation_type, request_time, request_status)
- multimedia_content(multimedia_id,post_id,multimedia_name,multimedia_type, multimedia_content,access_id)
- comment(comment_id,post_id,desc,comment_date,commentor_name,access_id)
- location(loc_id,post_id,name,description,latitude,longitude,access_id)
- likes(like_id,post_id,comment_id,multimedia_id,loc_id,viewer_name,like_date)

Foreign Keys:

- ssn in signin table is a foreign key referencing the ssn in the employee table.
- ssn in the registered_employee table is a foreign key referencing the ssn in employee table.
- post_id,profile_name in wall table references the post_id in post and profile_name in the registered_employee table respectively.
- In multimedia_content table post_id is the foreign key referencing table post.
- In comment table post_id is the foreign key referencing table post and commentor_name is the foreign key referencing table registered_employee.
- In like table likes viewer_name is the foreign key referencing table registered_employee and post_id is the foreign key referencing table post and multimedia_id is the foreign key referencing table multimedia_content and loc_id is the foreign key referencing table location.
- In relationship table sender_name references table registered_employee.

DDL STATEMENTS:

```
create database BigApple;
